Founder: Prof. Dr. S. B. Mujumdar, M. Sc., Ph. D. (Awarded Padma Bhushan and Padma Shri by President of India)

Experiment No. 8

Title: Access and validate form fields using events; design a gym admission form with live input checks.

Software / Tools Required:

1. Visual Studio Code
2. Google Chrome
3. HTML5
4. JavaScript (ES6)

Theory: JavaScript provides methods and events for accessing HTML form fields, monitoring user input, and validating the data entered by a user. Form validation helps ensure that required information is entered correctly before the form is submitted. Events allow validation to happen during user interaction.

a) Accessing Form Fields:

1. DOM access → Form elements can be accessed using their id, name, or other selectors.
2. value property → The value entered in text boxes, email fields, and other controls can be read.
3. checked property → Radio buttons and checkboxes can be checked to determine the selected options.

b) JavaScript Events:

1. input event → Runs whenever the user changes the value of a form field, making it suitable for live checks.
2. change event → Runs when the value of a field is changed and the control loses focus.
3. submit event → Runs when the form is submitted and can be used to stop invalid data from being sent.
4. click event → Runs when a button, checkbox, or radio control is clicked.

c) Form Validation and Live Input Checks:

Validation can check whether the name is entered, the email follows a valid pattern, the phone number contains the required digits, a gender is selected, and other required fields are completed. With the input event, messages can be displayed immediately while the user types, helping correct errors before submission.

Case Study: A Gym Admission Registration Form was designed using HTML and JavaScript. The form contains fields such as name, email, phone number, gender, age, membership type, and other required information. JavaScript accesses these fields through the DOM and uses input, change, click, and submit events to validate the entered data. Live input checks display suitable validation messages while the user enters information, and the submit event prevents incomplete or invalid data from being submitted.

Conclusion: The practical was completed successfully. Form fields were accessed through the DOM and JavaScript events were used to monitor user interaction. Live input validation was implemented to identify incorrect or missing information immediately. A Gym Admission registration form was designed with appropriate validation for user details, selections, and form submission.
